Claims

[c1]   1. A method for replacing a language of a user interface without having to restart an application, used to replace the language of the user interface in the same set of computer, comprising:
choosing a desired language;
searching a corresponding external language file;
searching a corresponding language string; and
directly redrawing the user interface without having to close the application.

[c2]   2. The method of claim 1, wherein the step of directly redrawing the user interface without having to close the application is to redraw the user interface of the original language with the user interface of the desired language.

[c3]   3. The method of claim 1, wherein the language string can be modified to comply with the desired language when there is no language string corresponded to the desired language.

[c4]   4. The method of claim 1, wherein the external language file can be modified to comply with the desired language when there is no external language file corresponded to the desired language.

[c5]   5. The method of claim 1, wherein the language comprises a variety of languages.

[c6]   6. The method of claim 1, wherein the language string comprises a variety of language strings.

[c7]   7. The method of claim 1, wherein the external language file comprises a variety of external language files.

[c8]   8. The method of claim 1, wherein the application is operated on an operating system.

[c9]   9. The method of claim 7, wherein the operating system comprises a variety of operating systems.
